

Measure your plants

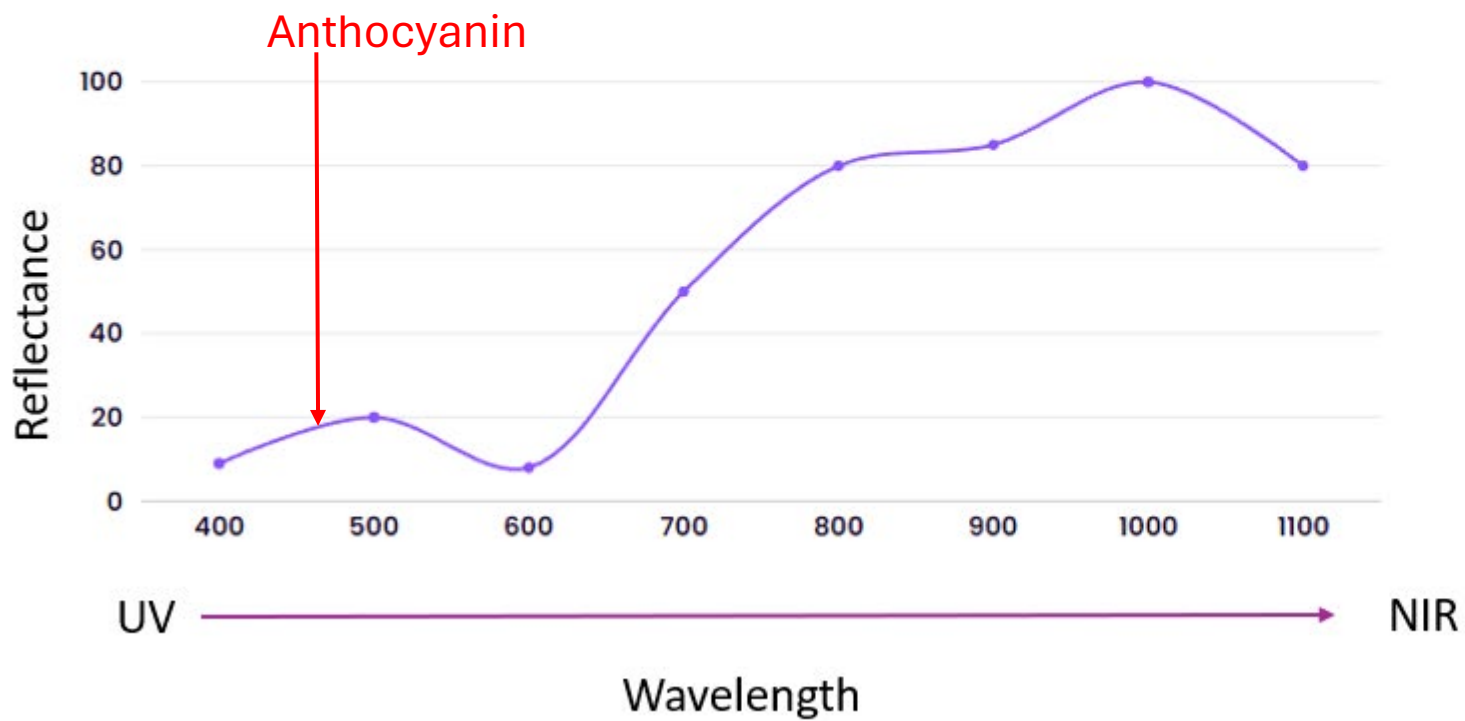

**SPE**  **AI**

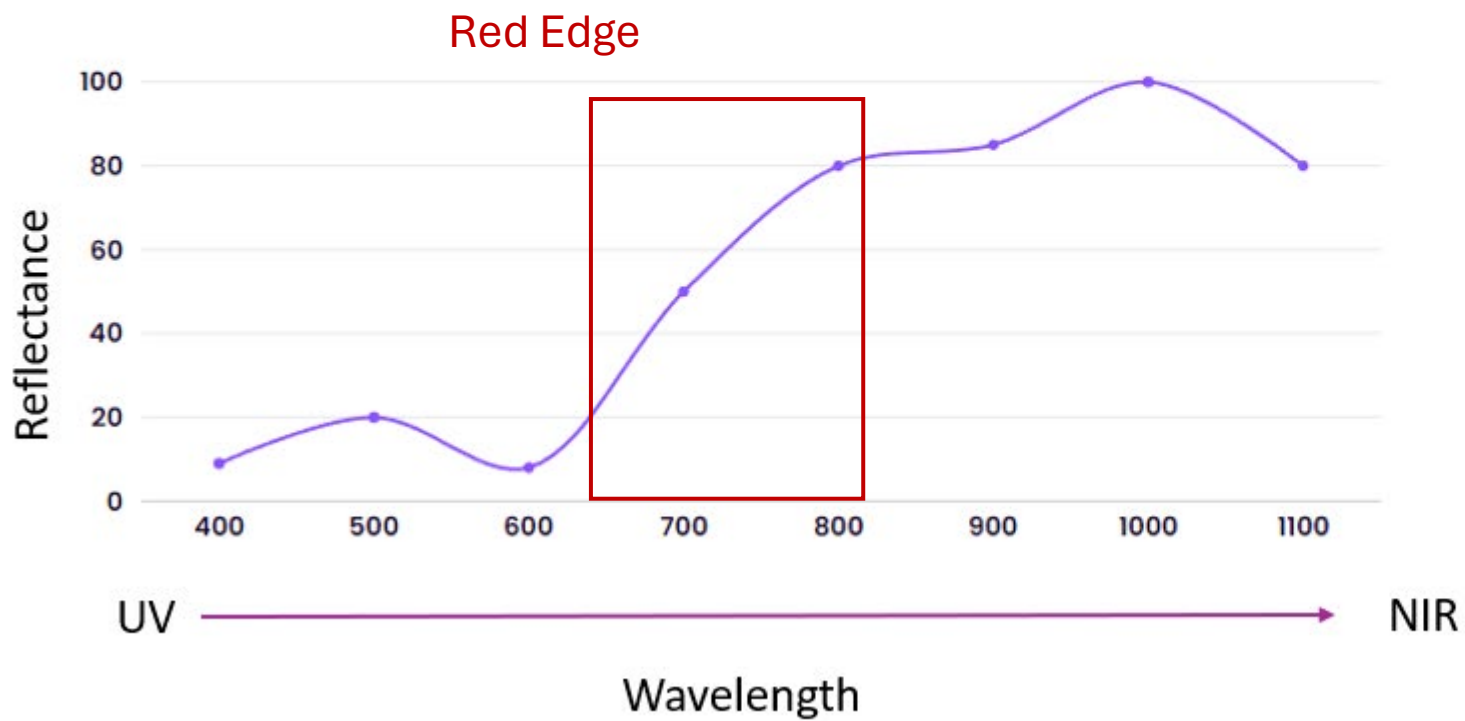

Hyper spectral imaging

# What we scout for

---

- ▶ Pests, LeafMiner, Spider Mites, Aphids
- ▶ Diseases, Powdery Mildew, Botrytis
- ▶ Hop Latent Viroid
- ▶ ...

# Botrytis

---

Date:  
2020-09-19

Time :  
04:26:18

# Botrytis

---

Date:  
2020-09-19

Time :  
04:26:18

Botrytis Probability:  
99.99988 %

▶ Up to 10 days  
before visual  
symptoms  
appear

# Deficiency

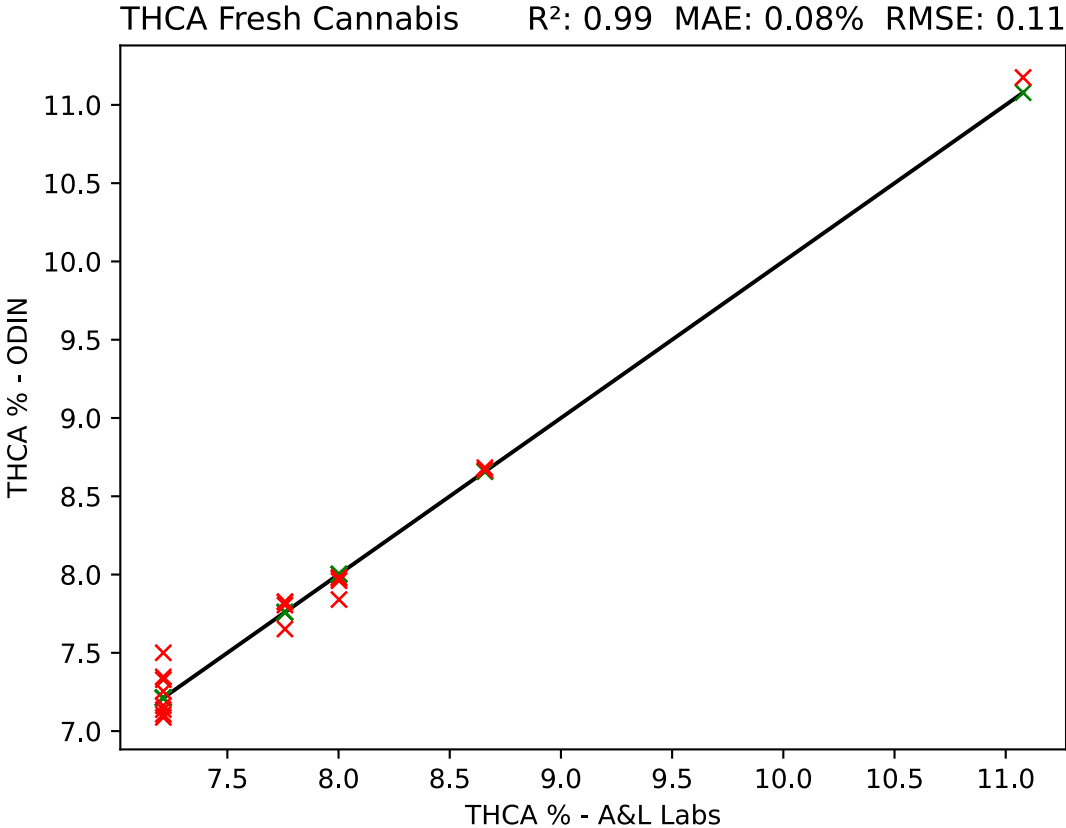

---

▶ Detect them  
early and act  
on them

# THC value

img 1

**3D imaging**

# 3D imaging – What we measure

- ▶ Plant Height
- ▶ Leaf Angle Distribution
- ▶ Internodal Distance
- ▶ Volume of Flowers

img 1

Thermal imaging

# Thermal imaging – What we sense

- ▶ Leaf Temperature:  
(25-30°C during day ideal?)
- ▶ Leaf VPD
- ▶ Crop Water Stress Index
- ▶ Actual Transpiration Rate

# What makes us unique in MCPIR

---

 **We are on a mission to simplify cultivation.**

Measure: Yield and flower growth over time

--> Less manual measurement

Scout: Botrytis, Powdery Mildew, HopLatent Viroid,  
Pests

--> Problems we will hopefully never have here

Ask me anything...

# Why we joined MCPIR

- ▶ To better understand and model Plant <> Environment interaction

# Plant Environment Interaction matters

- ▶ We know temperature and light have a huge impact on plant development.
  - > Yield
  - > Risk for diseases

But we need to know the actual transpiration rate.

# Factors that affect transpiration rate

---

- ▶ Light Intensity
- ▶ Temperature
- ▶ Air movement
- ▶ Humidity

But while we can only measure leaf temp on a plant level at canopy, environmental sensors are still too expensive to deploy at plant level.

# Computational Fluid Dynamics

---

## What is CFD?

### Simulation of Fluid Flows:

Uses numerical methods to model liquid and gas behavior, solving complex equations to predict fluid interactions.

### Wide Applications:

Crucial in aerospace, automotive, civil engineering, and environmental studies for designing and improving systems.

# CFD for cannabis cultivation

## Why use CFD in horticulture?

### Optimal Ventilation:

Ensures even airflow promoting healthy growth.

### Uniform CO2 Distribution:

Enhances photosynthesis and growth by maintaining consistent CO2 levels.

### Temperature Control:

Maintains consistent temperatures for optimal plant growth.

### Humidity Management:

Ensures uniform humidity levels to prevent mold and mildew.

Temperature

# Model transpiration rate

---

- ▶ Light Intensity --> CFD
- ▶ Temperature --> CFD
- ▶ Air movement --> CFD
- ▶ Humidity --> CFD

Develop Cannabis specific transpiration models.

# MCPIR

- ▶ Expand knowledge on Cannabis Cultivation
- ▶ Simplify Cultivation
- ▶ Cannabis is a plant, learn from experience
- ▶ Provide value to growers
